# Policy Background

## ***NAAQS Secondary Standard NO<sub>x</sub>/SO<sub>x</sub>: EPA's Final Rule "after a 5 plus year science review and assessment"***

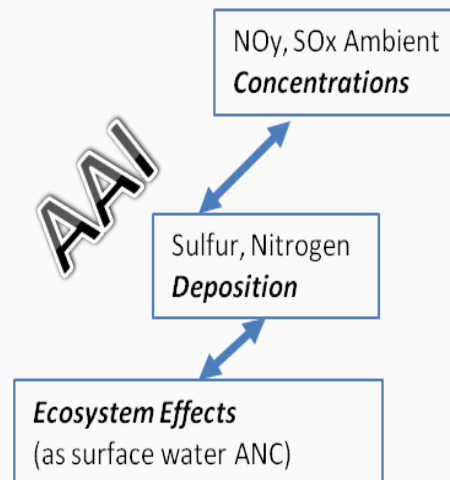

- *Current secondary standards afford inadequate protection*
- *Decision not to move forward with a new standard based on AAI concept*
- *Conduct a pilot studies field program in 3-5 ecoregions:*
  - *"to collect and analyze data so as to enhance our understanding of the degree of protectiveness that would likely be afforded by a standard based on the AAI..."*

# Background

## **The *Aquatic Acidification Index (AAI)* relates:**

- Ambient concentration NO<sub>x</sub>/SO<sub>x</sub> (i.e., SO<sub>x</sub> as SO<sub>2</sub> and SO<sub>4</sub>, and NO<sub>y</sub>)
- Resulting level of acidifying deposition
- Environments ability neutralize acidifying deposition (i.e. CL)
- Potential ecological effects associated with acidifying deposition (i.e. ANC)
- Contribution of ammonia to acidification process

# Translating a linked atmospheric-biogeochemical construct in NAAQS terminology

## AAI derivation

$$CL_{N+S} = ([BC]_0^* - [ANC_{lim}])Q + Neco$$

Start with CL

expression:

Define a potential ANC based on the relative difference between CL and deposition

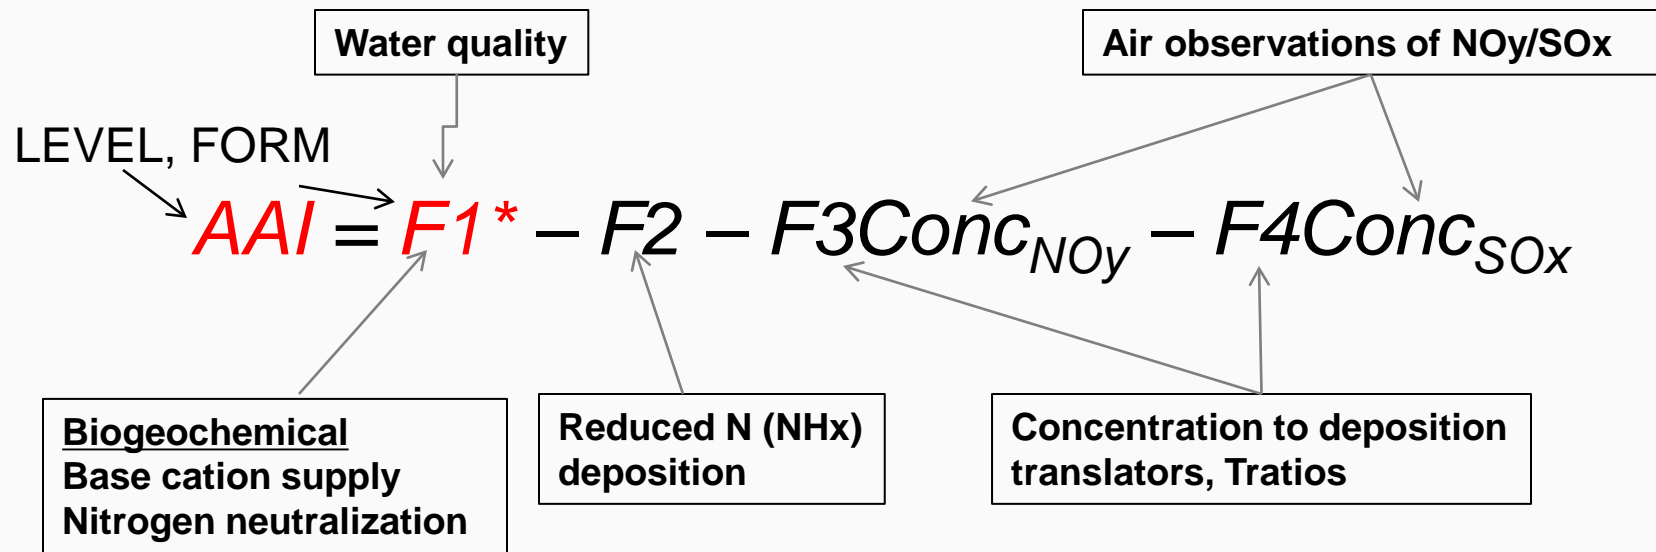

Ambient indicators

$$[ANC_p] = [BC]_0 + Neco/Q - Dep_{NHx}/Q - T_{NOy} Conc_{NOy}/Q - T_{SOx} Conc_{SOx}/Q = AAI_{WB}$$

# Translating a linked atmospheric-biogeochemical construct in NAAQS terminology

$$AAI_{WB} = [BC]_0 + Neco/Q - Dep_{NHx}/Q - T_{NOy} Conc_{NOy}/Q - T_{SOx} Conc_{SOx}/Q$$

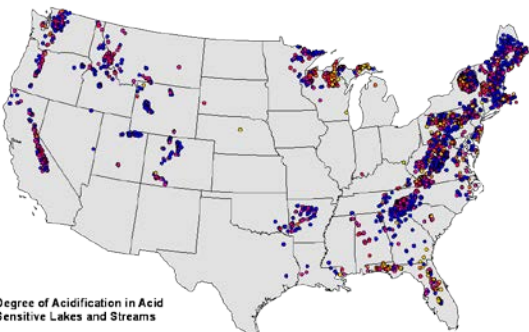

*Charge balance between major cations supplied by ecosystem and acidifying anions contributed by deposition: interpreted as the potential ANC water bodies would realize from an atmospheric state.*

# Accommodating homogeneity and heterogeneity in a national application – spatial aggregation

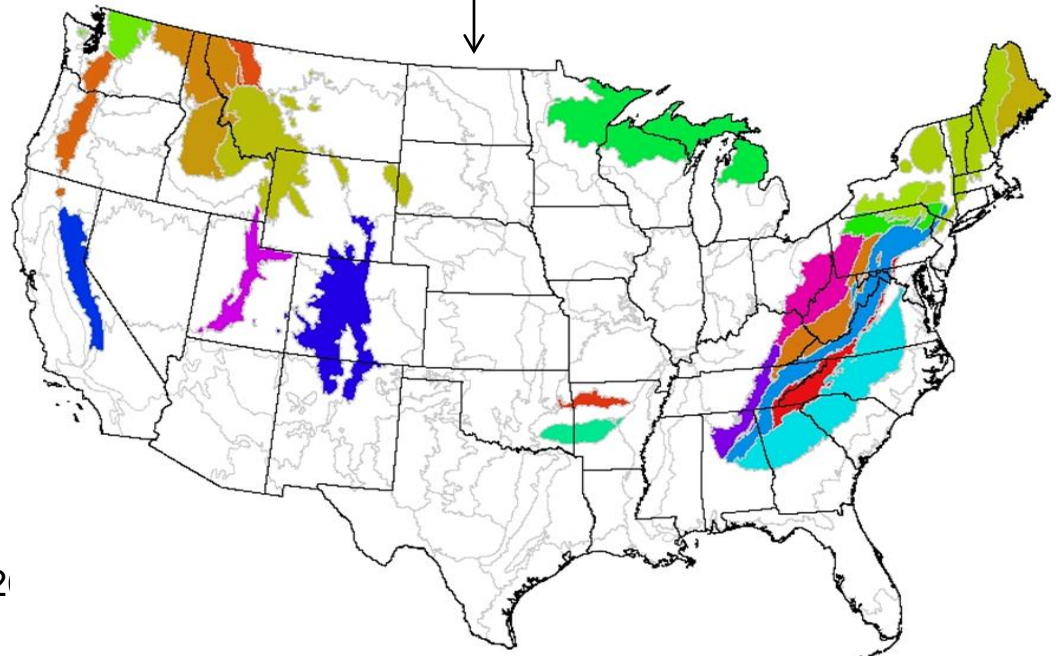

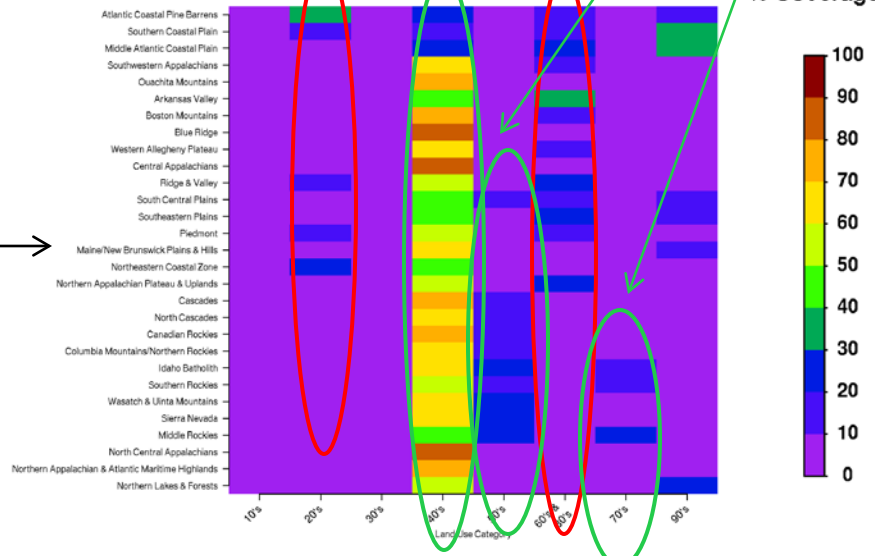

Developed/Ag forests, shrubs, grasses

**Degree of Acidification in Acid Sensitive Lakes and Streams**

- Acute Acidification < 0
- Severe Acidification 0-20
- Elevated Acidification 20-50
- Moderate Acidification 50-100
- Low Acidification >100

Objective - to focus on sensitive areas (based on ANC –left panel) and are likely to benefit (using NLCD rt. panel) from reductions in deposition segregated into similar biogeochemical attributes (Omernik ecoregions – below)

# Does this work?

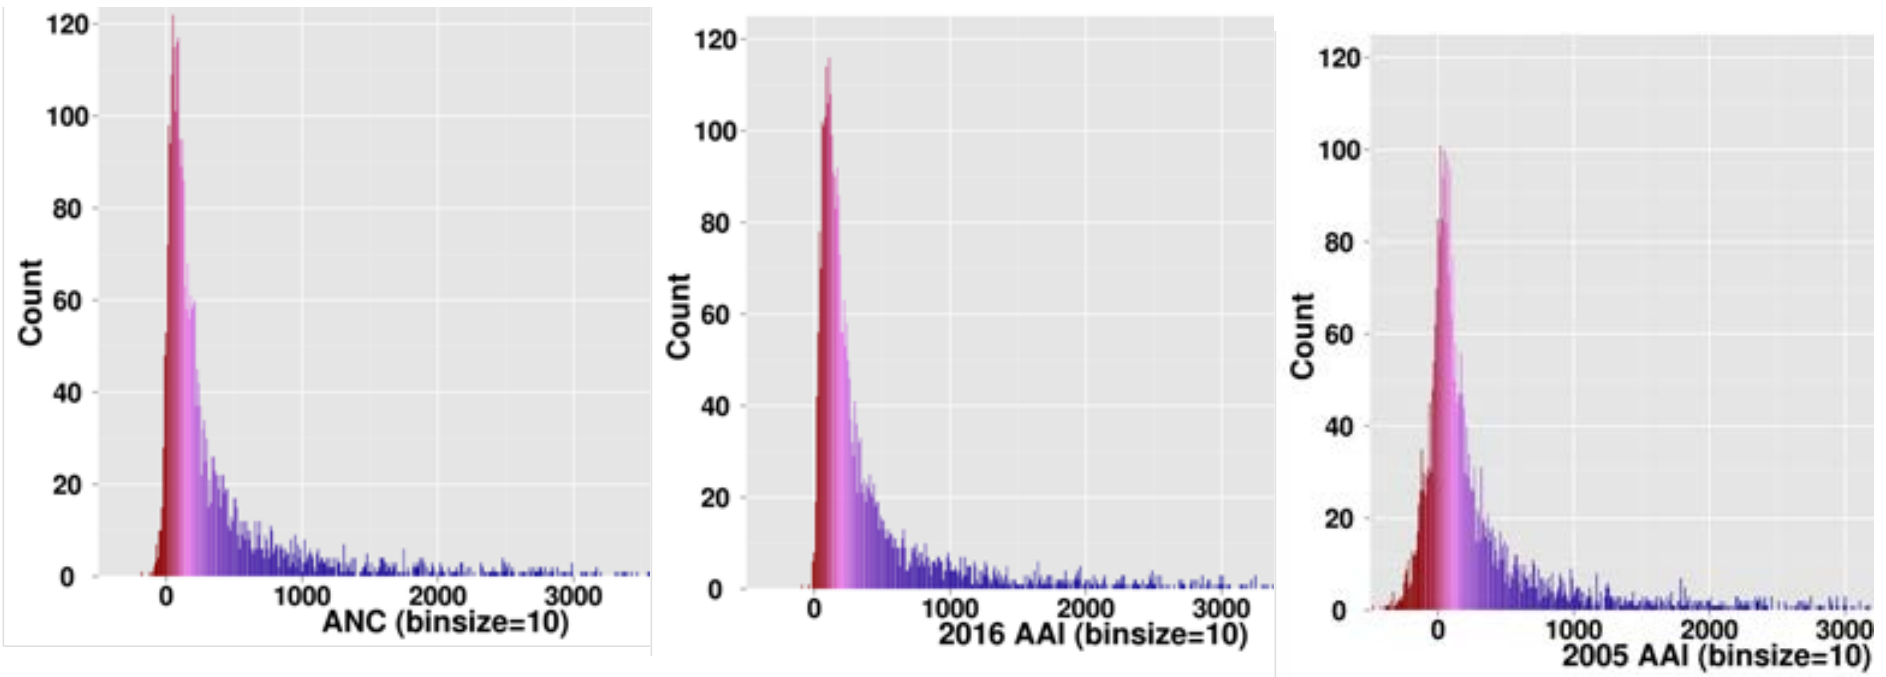

Comparison of calculated AAI values with observed ANC  
Offset due to possible deposition bias and SS assumptions – lag in cation leaching rates, sulfate adsorption/release, possibly associated with water quality sampling periods

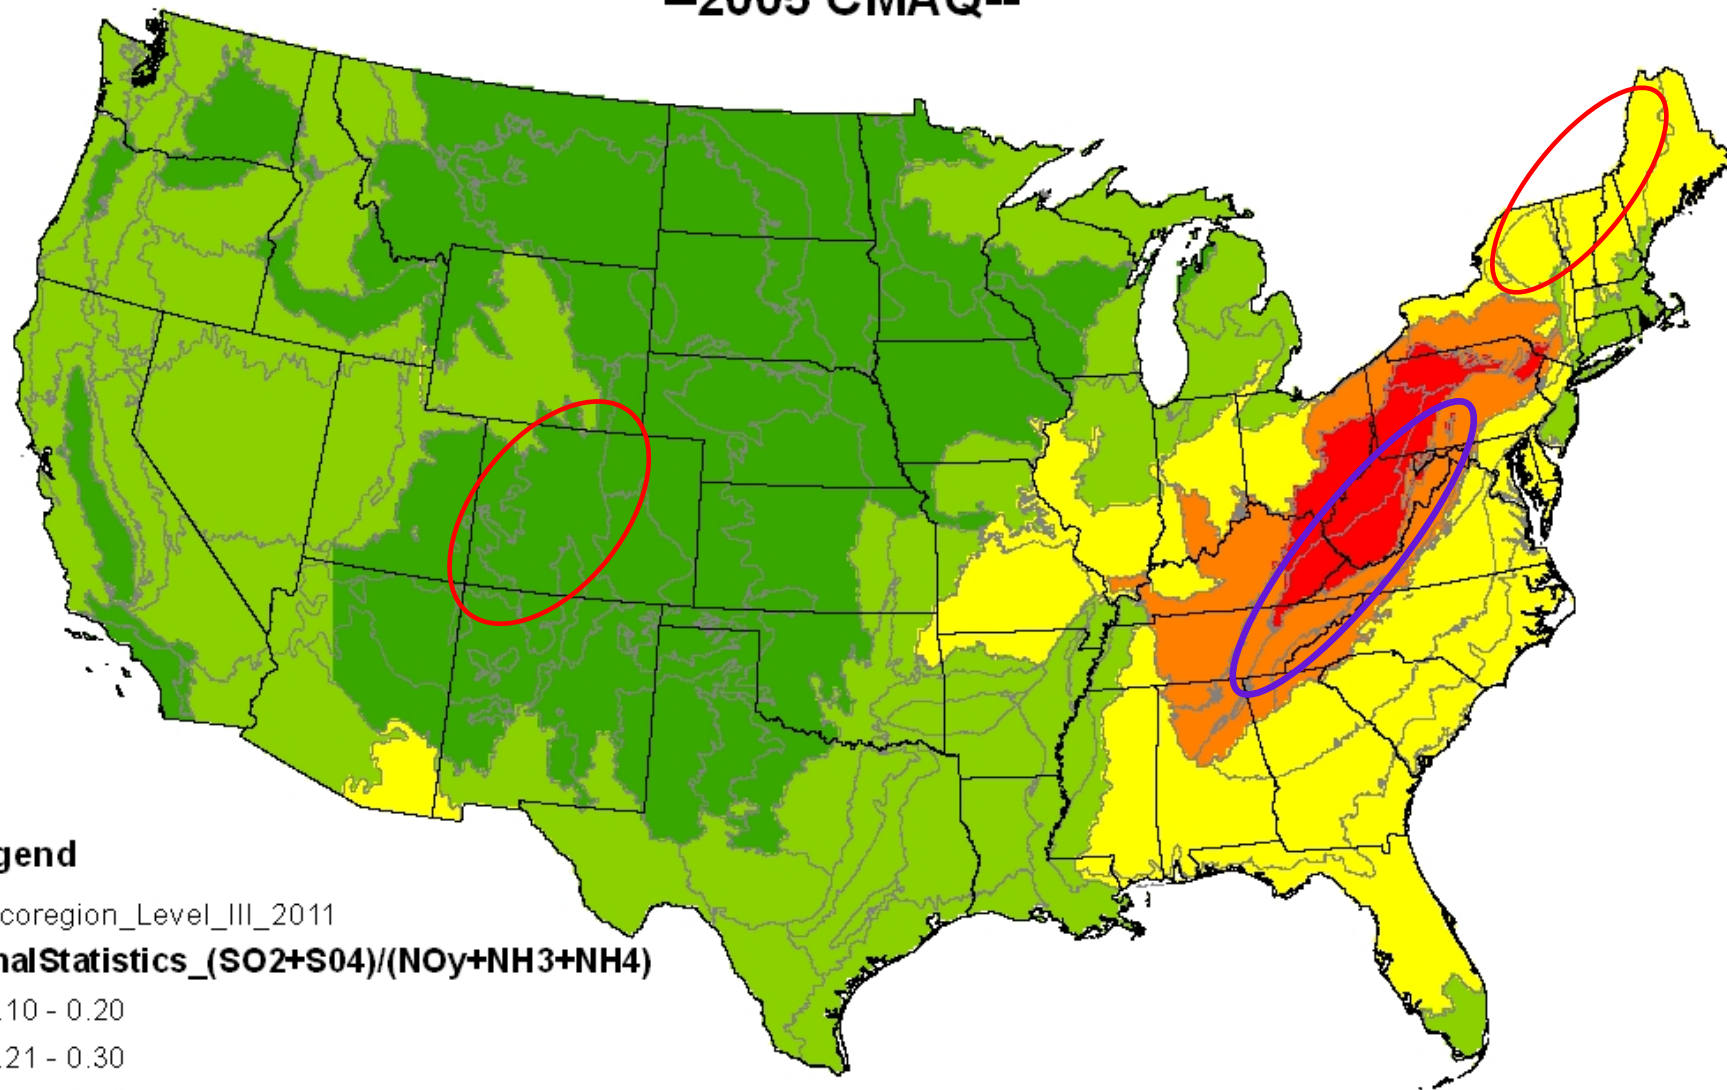

Differences (ANC-AAI) segregated by water quality sampling year

National distributions of observed ANC, 2005  $AAI_{WB}$  and 2016  $AAI_{WB}$ .

# SO<sub>x</sub>/(NO<sub>y</sub>+NH<sub>x</sub>) Annual Average Concentration (ppb) Ratio per Ecoregion --2005 CMAQ--

## Legend

□ Ecoregion\_Level\_III\_2011

ZonalStatistics\_(SO<sub>2</sub>+SO<sub>4</sub>)/(NO<sub>y</sub>+NH<sub>3</sub>+NH<sub>4</sub>)

■ 0.10 - 0.20

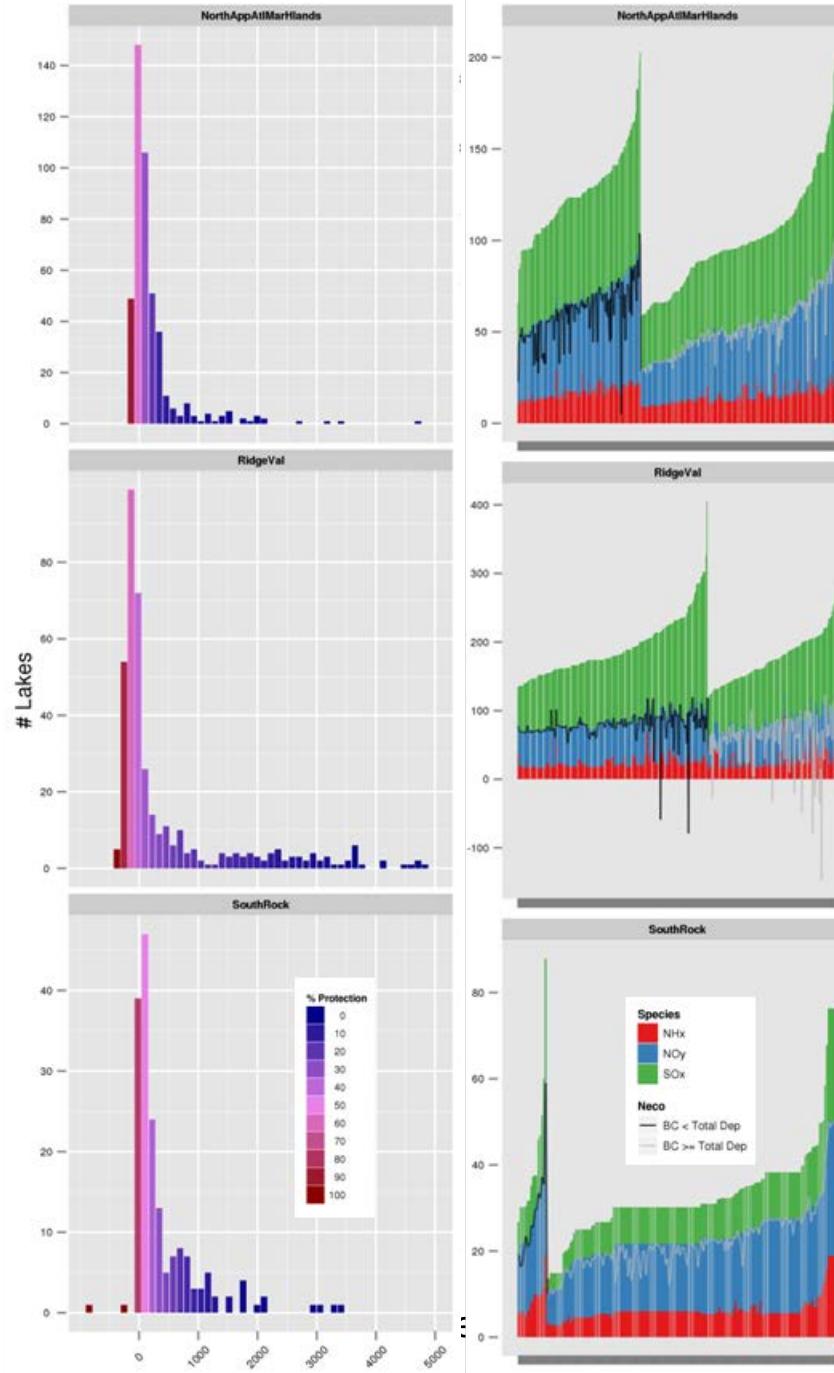

■ 0.21 - 0.30

■ 0.31 - 0.40

■ 0.41 - 0.50

■ 0.51 - 0.59

Example  $AAI_{WB}$  Distributions (left) for 3 regions and deposition and base cation flux components (right)

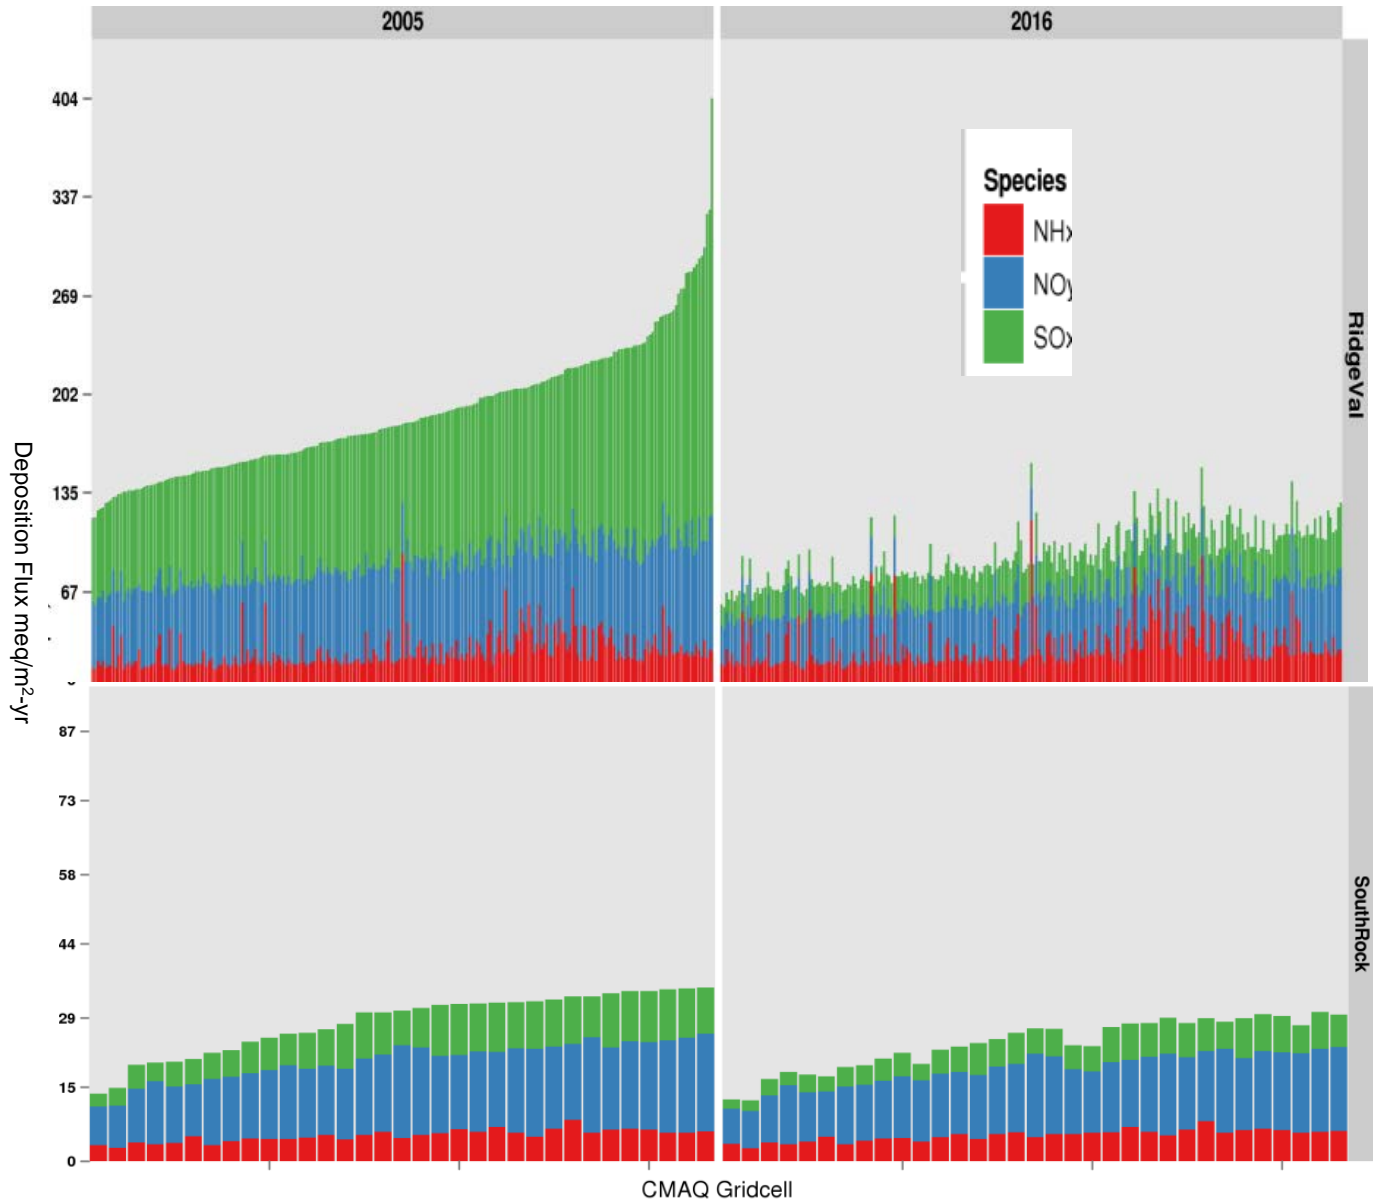

Adirondacks

Central Appalachians  
(Ridge and Valley)

Southern Rockies

Variations in pre-industrial base cation flux

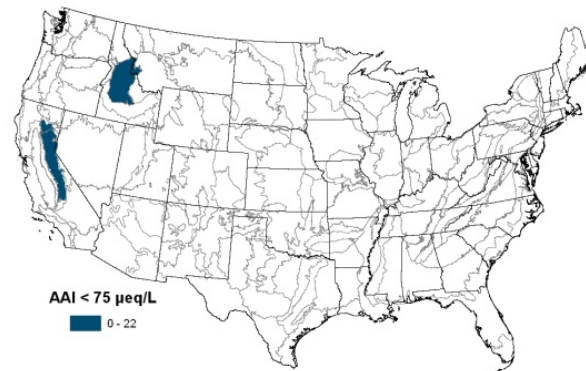

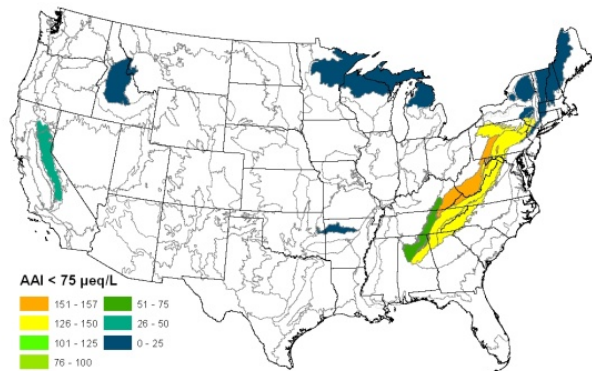

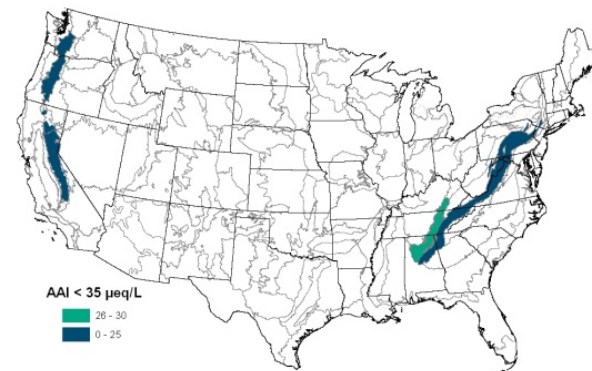

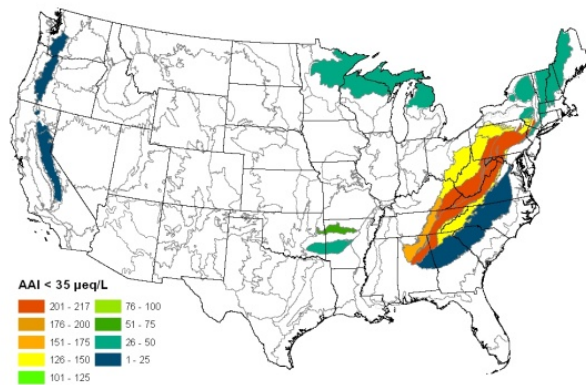

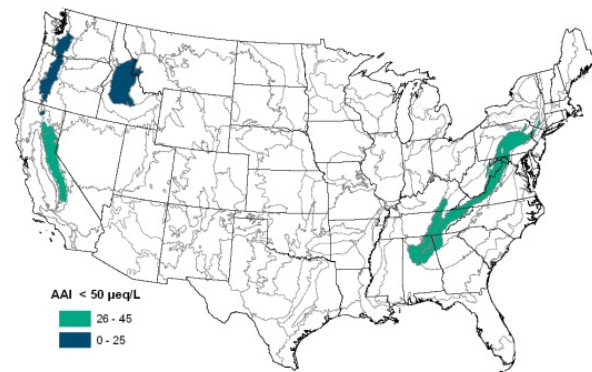

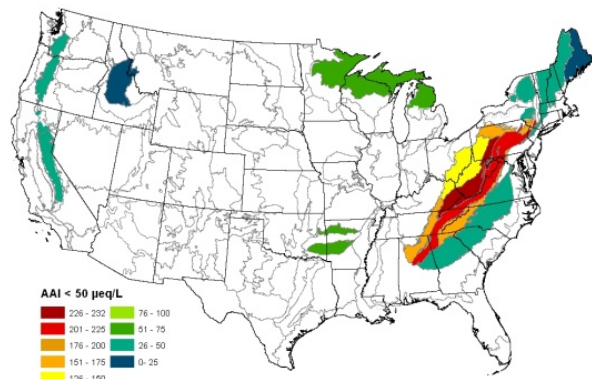

Deposition components  
For Appalachian (top) and Rocky Mtn. regions for 2005 (left) and 2016.

Transition from S –N contribution in East. Elevated importance of NH<sub>x</sub> everywhere

*Combining Level (target ANC) and Form (% lakes protected)*

2005 (left) and 2016 (right) AAI Exceedances for cases 50/90 (top); 35/90 (middle) and (75/70).

- *Accommodating data scarcity in a national application*
  - Would a standard
    - reduce the ratio of modeled data/observations?
    - enable focus on area's with more complex response behaviors (e.g., central Appalachians)?
    - Increase S,T commensurability between atmospheric and water sampling campaigns?
    - Increase range and consistency of water quality sampling in western systems?
- Tradeoff between averaging quantities and respecting heterogeneity
- Use of dynamic water quality models to characterize relative importance of simplified process parameterizations
